3DS Export For SketchUp

The 3D Studio 3DS File Extension has been updated to version 2.0. This version contains major bug fixes and functionality improvements. The core of this plug-in is the OpenCSG library (version 2.2.1) and it's source code. The library is used to convert objects in SketchUp into a 3D mesh (triangulated surface) then export these mesh to the 3DS file format (3ds,.3ds,.obj,.x,.dae) A 3DS file is a vector based format, so it can be converted into a PDF without losing the texture of the 3D object. It's vector based, so it can be converted into any type of picture format. The 3DS mesh is created by applying a series of rules. Each rule will process a part of the object to determine how it will be tessellated. You can apply each of the rules to specific groups or layers in the SketchUp document. Every rule can also be toggled independently. The rule toggling dialog contains an easy-to-use drop down control. The object can be cut. After cutting, it has been tessellated as an SVG image. The 3DS file export can be set to generate a PDF (Print Preview) file for converting the 3D files into pictures. The 3DS file structure (3d,.3ds,.obj,.x,.dae) can be set for the export. It can be to "Generic" or to a specific type. This feature will allow to manually set the correct 3D file format. 3DS Export for SketchUp can be used to export SketchUp objects to a 3DS file. The mesh that it creates may be sliced (some slices may be invisible) and it may require manual placement of hidden and visible meshes and the use of edges to connect the hidden and the visible meshes. Workplane is a SketchUp tool which provides an easy interface to automatically generate workplanes.
