Consider how much work it is to "write" a single area of a program. A good way to measure your time spent not what would have been better but, if you dropped the details and slowed things down. Imagine it re-done now with a lot more details, and a little better logic in your head could do the same thing. Trying to write super complex stuff always ends in power failure for me. E.g. all of the CRUD stuff is trivial. Given the option I choose not to do that myself for that reason. There's nothing wrong with simple. There's much wrong with overcomplicating things. That said, it's possible to do things in a simple straightforward manner that doesn't necessarily pass off as a mindless robot task that is of no use to humans. In other words its possible to make something that is moderately usable without having an army of a brain. But, and again, thats not the point. The point is that not all things can be made simple or all things can be made extremely complex. It all depends on the task. Advisory to fellow programmers: Do not make programming projects with classes in a blank canvas. rainshard wrote:There's nothing wrong with simple. There's much wrong with overcomplicating things. Innocents + lunatic Thu, 15 Apr 2018 17:41:26 Tarnished is a pretty neat game that I'd be interested to see more. It's basically a 3D version of what you can do with the classic Nintendo 64 game Wizard's Workbench, where you can harness divine powers to restore objects to their proper places. Although the controls are still clunky, and the game looks a bit low resolution, and some elements might take a little while to get used to, it's an interesting idea that actually works. The basic concept is that you're a tinker, restoring order to a magical world made up of puzzle pieces. You're given a randomly generated 3D world, where you're tasked with restoring various types of objects. You'll encounter a whole lot of trial and error, sometimes including losing the ability to restore an object, because you've either restored it wrong or it's just too much of a pain to do it again. You can solve puzzles with your inventions as well, and you're encouraged to use them. This isn't a game about story and hand-holding. It's a game about experimentation, problem solving, and creativity. It's a game about exploring and adventuring. The fact that you're given little explanations of what's going on and why is probably the game's only flaw. However, it's probably because that's actually a good thing. It's meant to encourage players to put aside their preconceptions about what they should be doing and just play the game. The game is completely free, but you can unlock some additional

stuff that gives you access to more game types and stages. There are also optional items you can buy in the "store" that gives you the ability to speed up the game or allow you to undo some of the objects you've restored. It's not difficult to take out a few hours to see if this game is something you enjoy. Elden Ring may not be as good as you'd like, but it's a new and bff6bb2d33

Fri, 28 Oct 2018 17:28:00 +0000ROBOT IN YOGI>In a packet drop call of a fixed codebook scheme, a transmit power control mechanism provided in a user equipment (UE) includes an on-off control of a high-layer (mobility, terminal identifier, etc.) control channel. In order to transmit information of the high-layer control channel, a total of eight on-off times (obtained by dividing the entire length of the high-layer control channel by 8) in the packet drop call are required. Each on-off time includes a control channel sub-frame #1 where field size of the high-layer control channel is 0.5 ms, a control channel sub-frame #2 where field size of the high-layer control channel is 1.25 ms, and so on. In a long term evolution (LTE) Radio Access Network (RAN) packet drop call, the contents are as follows: a length of a control channel sub-frame is 0.5 ms, and an on-off time is 2 ms. At present, in the LTE RAN packet drop call, a method of determining the on-off times of the high-layer control channel only considers the total length of the high-layer control channel and the on-off times of the control channel sub-frame 1, 2 and so on, in the packet drop call. After 8 times of packet drop visits to the control channel sub-frame,

1. Field of the Invention The present invention relates to an image processing apparatus for processing an input image and a control method thereof. 2. Description of the Related Art Recently, an image processing apparatus, such as an MFP (Multi-Function Peripheral), has been proposed in which a document is read by a scanner and a user uses the scanned image as an image to be inserted on an email, as an inserted image, or for other various uses. For such an image processing apparatus, there is proposed an image processing apparatus in which both reading and scanning processing of a document are performed at the same time by using an image capturing section and an image processing section (see, for example, Japanese Patent Laid-Open No. 2009-269643). This apparatus includes a printer driver for a printer and a scanner driver for a scanner and is capable of reading and scanning a document at the same time by using the printer driver and scanner driver and performing image processing processing in each of the reading and scanning processes. This apparatus enables the user to operate the document feeding operation, such as the reading operation, by using an operation panel of the image processing apparatus without depending on skill. The user can determine whether or not the document is to be read at the desired reading position. Since the conventional image processing apparatus described above enables the user to operate the document feeding operation, such as the reading operation, by using an operation panel of the image processing apparatus, the user can perform only the reading operation of the document in a state in which the user is away from the image processing apparatus. Therefore, the image processing apparatus may be left as it is. In the conventional image processing apparatus, however, the image capturing section is generally arranged in such a manner that the image capturing section captures a document in a state of being fed from a document feeding section disposed above. In this case, the image capturing section sometimes captures, depending on the document setting state, a document in a state of having been rotated. Such a document in a rotated state includes, for example, a document which has been folded. In general, the image processing apparatus cannot recognize that a document has been folded, but a document which is folded in the form of a letter and a document which is folded into two at the middle of an image are similar to each other, so that it can be easily determined that a document has been folded. Therefore, in order to process a document in a rotated state, it is preferable to have the document rotated
